Getting Started

Download the ELEY x-shot app to your mobile device.

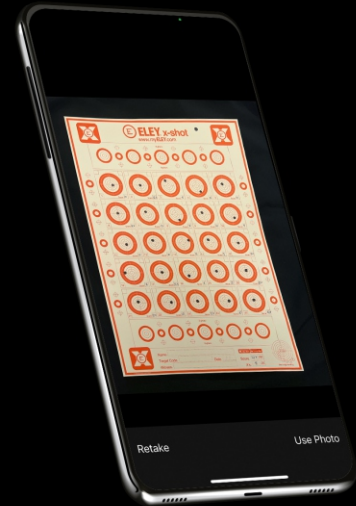

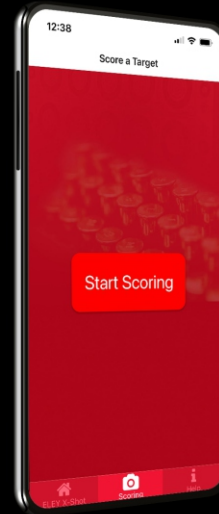

Start Scoring

Click on the Score Targets button, followed by the Start Scoring button.

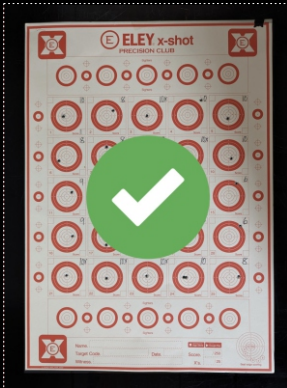

You will be prompted to take a photograph of your completed target.

If you are using an Apple device your photograph will load directly into the app.

If you are using an Android device, take a photograph of your target and select the photograph from your devices camera roll when prompted.

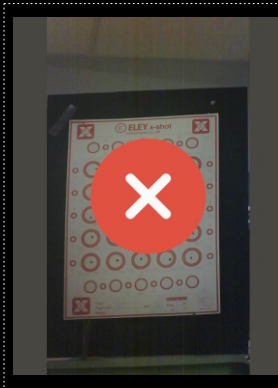

This is a good photo for scoring.

The background isn't flat or Black.

The target is too far away and/or out of focus.

Steep angle and/or a light background is bad.

For the best results take a photo in good lighting conditions. Place your Target on a flat Black surface and leave 1" or 25mm of Black background around the outside of your Target.

Algorithms

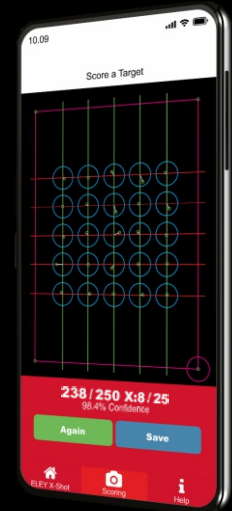

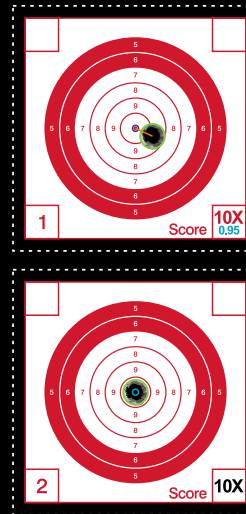

After clicking the Use Photo button the ELEY x-shot algorithms will analyse all the 25 details of your shot data.

Orientation is determined by three points displayed within the Target.

X, and, Y, co-ordinated are then analysed to work out the centre of your shot hole and the centre of the detail.

Distance and Pixel recognition give a confidence score out of 100%.

Any number displayed in Red has a low confidence score and should be checked.

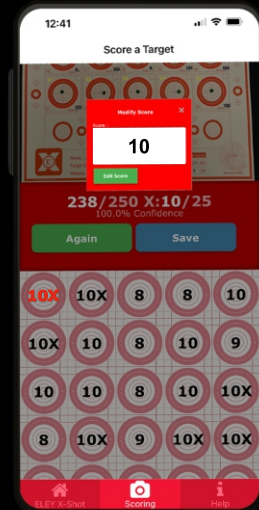

Amendign Scores

If you have received a score marked in Red, it means you should manually check the score of that detail.

Check the shot on your target, if your score is different from the app score, adjust it manually by clicking on the displayed score.

After the score has been manually adjusted and you have clicked the Edit Core button, it will appear in Red and underlined.

10X should be scored with a capital X.

Once your scores are amended,

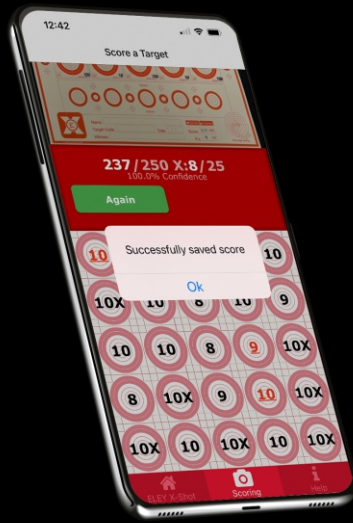

Click the Save button.

All your historic competition and training data will be uploaded to your Competition Dashboard Cloud.
